Executive Summary

Passive safety systems refer to collection of systems in the car which protects the driver and passengers from injury if an accident occurs. These automotive safety systems have been around since decades with the implementation of seatbelts by Volvo in the year 1959. Passive safety systems such as Airbags, Seatbelts, Steering Wheel and Electronic Control Unit (ECU) minimize the risk of injury in an accident. For example, Airbags provide a cushion to protect the driver and passengers during a crash; Seatbelts restrain passengers in place so that they are not thrown forward or ejected from the car. These systems are engaged when the collision takes place; some features helps in absorbing crash forces; some restrain occupants from colliding with the vehicle interior, and other prevents objects inside the vehicle from striking the driver or passenger. In order to evaluate passive safety systems, automotive manufacturers along with the government in various nations perform tests to evaluate how well the systems perform in crash scenarios.

The growth of the segment is driven by increasing focus of consumers on safety, rise in number of safety regulation in nations worldwide and growth of global automotive industry. However, factors such as rising cost of raw materials, price competition, exchange rate fluctuation, reliance on specific customers and product defect risk are posing challenge to growth of the industry. Major trends prevailing in the market are deployment of active steering wheels, Vacuum Folding Technology (VFT) Airbag and Flexible Venting Technology (FVT) Airbag.
