### Executive Summary

Rheumatoid arthritis (RA) is a chronic inflammatory disorder that principally attacks synovial joints. It is one of the most common autoimmune diseases affecting people of

all ages and races. RA affects the lining of joints, causing a painful swelling that can eventually result in bone erosion and joint deformity. It also leads to stiffness, and redness in the joints. The main factor causing rheumatoid arthritis remains unknown. However, according to studies around the world some of the genetic and environmental factors are found to be more probable causers.

Treatment of Rheumatoid Arthritis involves frequent drugs administration as RA is a progressive and incurable disease. Drugs used for treatment of RA are classified as first line agents- consisting of non steroidal anti-inflammatory drugs (NSAIDs) and steroids such as glucocorticoids and second line agents- consisting of disease modifying anti-rheumatic drugs such as chloroquine, gold salts, penicillamine, cyclosporine, and several biological agents like TNF- $\alpha$  and interleukin-1 inhibitors.

Global rheumatoid arthritis market is driven by increase in incidences of RA patients, global ageing population and increasing healthcare expenditure by government of various nations. Factors which are affecting pharmaceutical companies are pricing pressure, patent expiries of RA drugs, high costs of treatments involved and escalating R&D costs. The market is characterized by use of auto-injectors by patients for RA treatment, increase in RA cases in women and FDA approvals for RA drugs.
