## EXECUTIVE SUMMARY

A seed is a primary part of plant and is formed after the fertilization of ovules of plant. A seed contains an embryo and has capacity to germinate and produce a new plant. The embryo is made up with a radicle. The seed is present inside a fruit which further convert into a new plant, the new plant provides different varieties of fruit, vegetable and manure for humans and animals.

Seeds are bifurcated in two type monocotyledonous and dicotyledonous seed. Monocotyledonous seed includes maize grain and rice grain seeds. Whereas, dicotyledonous seed consist of gram, pea and castor oil seeds. Furthermore, the seed can be further categorized in conventional seeds and genetically modified seeds. Conventional seeds are the normal traditional seeds. Whereas, genetically modified seeds help farmers to enhance the crop yield and facilitate cultivation of rich crop variations.

The global seed market has observed consistent growth in the past few years and is anticipated that the market would witness moderate growth over the forecasted period (2020-2024) owing to spread of pandemic disease COVID-19. Moreover, the market would observe moderate growth owing to various growth augmenting factors such as budding global population, escalating organic farming, increasing agricultural production, spike in demand for plant-based proteins, surging demand for biofuel and upsurge in government initiatives.

However, the global seed market is not free from challenges that are impeding the fueling growth of market. Some of the eminent challenges faced by the market are high equipment & maintenance cost and changing climatic conditions. Whereas, the market growth would be further supported by various market trends like evolution of IoT technology, agricultural drone technology and autonomous weed and crop maintenance.
