## Executive Summary

A sensor is defined as a device which can be used to sense a wide range of physical changes in the environment. Sensors usually detect and respond to some kind of input and convert that into an electrical signal. The specific input can be light, heat, pressure or any other environmental factors.

There is a specific criteria to choose a particular type of sensor. The criteria is based upon three factors, which are environmental factors (temperature range, humidity effects, ruggedness, self-test capability, etc); economic factors (availability, cost, life time, etc) and sensor characteristics (sensitivity, stability, error, range, response time, etc). The sensors can be divided into many types: temperature sensors, image sensors, pressure sensors, flow sensors, level sensors, chemical sensors, load sensors, bio sensors and position sensors. The sensors market can also be segmented on the basis

of technology, named as CMOS (Complementary Metal-Oxide-Semiconductor), MEMS (Micro-Electro-Mechanical System), NEMS (Nano Electromechanical System) and others.

A temperature sensor can be defined as a device which are used to detect and measure temperature through an electric signal. Temperature sensors have a long history with continuously evolving new generation temperature sensors. The temperature sensors market can be segmented on the basis of product type and application.

The global temperature sensors market has increased at a significant CAGR during the years 2015-2018 and projections are made that the market would rise in the next four years i.e. 2019-2023 tremendously. It is expected to increase due to increasing adoption of sensors in automotive sector, escalating use of sensors in industrial products, strong demand for sensors in smart home and building applications, growing adoption of sensors in healthcare equipments, etc. Yet the market faces some challenges such as declining personal computer's (PCs) shipments, threat from new or unanticipated competition, etc.
