EXECUTIVE SUMMARY

Rosacea is a common disorder associated with skin and most prevalent among people with light skin tone, and mainly affects areas around the chin, cheeks, nose, and forehead. The main characteristic of this disease is solid-bumps and pus-filled pimples.

Rosacea is a common chronic condition of the skin with a high prevalence rate among the U.S. population. It naturally begins at any time after the age of 30 or previously. In some cases, rosacea may also occur on the neck, chest, scalp or ears. Rosacea symptoms and signs include facial flushing, fine red vascular lines, swollen, red eyelids and many more. Currently, more than 16 million populations in the U.S. are suffering from rosacea.

The U.S. rosacea market has grown over the past few years and is projected to grow at a high growth rate on the back of rising incidence of disease, and aging population. The growth in the market will be driven by unhealthy eating habits and environmental factors, rising disposable income and entrance of new medications and treatments in the market. Yet the market growth is restrained by factors such as lack of awareness and knowledge and stringent government regulations for the approval of new drugs.
