Alphanate, (antihemophilic factor/von Willebrand factor complex [human]), is a sterile, lyophilized concentrate of FVIII (AHF) and von Willebrand Factor (VWF). Alphanate is prepared from pooled human plasma by cryoprecipitation of FVIII, fractional solubilization, and further purification employing heparin-coupled, cross-linked agarose which has an affinity to the heparin binding domain of VWF/FVIII:C complex. Alphanate is a combination medicine used to treat or prevent bleeding episodes in people with von Willebrand disease. Alphanate is also used to treat or prevent bleeding episodes in people with hemophilia A. Alphanate is contraindicated in patients who have manifested life-threatening immediate hypersensitivity reactions, including anaphylaxis, to the product or its components. Anaphylaxis and severe hypersensitivity reactions are possible. Development of activity-neutralizing antibodies has been detected in patients receiving FVIII containing products.
