Benlysta (belimumab) is the first in a new class of drugs known as B-lymphocyte stimulator (BLyS)–specific inhibitors. Belimumab blocks the binding of soluble BLyS, a B-cell survival factor, to receptors on B cells. BLyS is a member of the tumor necrosis factor (TNF) ligand superfamily and contributes to B-cell proliferation and differentiation. Although belimumab does not directly bind to B cells, it inhibits the survival of B cells, including autoreactive B cells, by binding BLyS. It also reduces the differentiation of B cells into immunoglobulin-producing plasma cells. Benlysta is a prescription medicine for patients with active systemic lupus erythematosus (SLE or lupus) receiving other lupus medicines. Intravenous dosing of Benlysta is approved for patients 5 years and older, and subcutaneous dosing is only approved for adults. It is not known if Benlysta is

safe and effective in people with severe active lupus nephritis or severe active central nervous system lupus.
