OVERVIEW

Loncastuximab tesirine (Lonca, formerly ADCT-402) is an antibody drug conjugate (ADC) composed of a humanized monoclonal antibody directed against human CD19 and conjugated through a linker to a pyrrolobenzodiazepine (PBD) dimer cytotoxin. Once bound to a CD19-expressing cell, Lonca is designed to be internalized by the cell, following which the warhead is released. The warhead is designed to bind irreversibly to DNA to create highly potent interstrand cross-links that block DNA strand separation, thus disrupting essential DNA metabolic processes such as replication and ultimately resulting in cell death. CD19 is a clinically validated target for the treatment of B-cell malignancies. It is being developed by ADC Therapeutics.

A Biologics License Application for Lonca for the treatment of relapsed or refractory

diffuse large B-cell lymphoma (DLBCL) is currently under review with the U.S. Food and Drug Administration (FDA) and has been granted priority review status.
