Pruritis Understanding

Pruritus (itching) refers to a sensation of the skin which causes a desire to scratch. Itching is a normal body response to protect us from harmful external substances or parasites such as insect bites. However, pruritus (or itch) is a common and distressing symptom of many skin diseases, systemic illnesses and psychological disorders. Itch is perhaps the commonest presenting symptom of skin disorders. In any two week period, 8-9% of the population suffer from significant pruritus. Pruritus lasting more than 6 weeks is called chronic pruritus. Pruritus may be localised to one area or generalized all over the skin. There are many possible causes, but for some people with pruritus no obvious cause can be found. Generalised pruritus without rash (especially in people over 65 years of age) is most commonly caused by dry skin. It may also be caused by medicines or by internal diseases affecting the body. There remain a small number of individuals with itch and no apparent underlying cause or rash. This is more common in the elderly.

Pruritis Pipeline Development Activities

The report provides insights into different therapeutic candidates in discovery and preclinical, phase 1, phase 2, and phase 3 stage. Drugs under development as a monotherapy or combination therapy are also included. It also analyses key players involved in Pruritis targeted therapeutics development with respective active and inactive (dormant or discontinued) projects with the appropriate reasons if available. Pruritis pipeline report covers 7+ companies. Some of the key players include Nippon Shinyaku (NST 141), GlaxoSmithKline (Linerixibat) etc.

The report is built using data and information traced from the researcher's proprietary databases, company/university websites, clinical trial registries, conferences, SEC filings, investor presentations and featured press releases from company/university web sites and industry-specific third party sources, etc.
