### Sacral Nerve Stimulator Overview

Sacral nerve stimulation, also known as the sacral neuromodulation comprises of implantation of the stimulator surgically, that sends across low-voltage electrical signals to the sacral nerves. The location of the sacral nerve is at the bottom of the spine, and is responsible for the bladder, bowel as well as the pelvic floor. The implantation of the stimulator helps in turn in the stimulation of the sacral nerve thus easing the fecal or the urinary incontinence. A hand-operated device helps to stop the contractions made in the sphincter muscles, in case of a need to empty out the bowels.

The sacral nerve stimulators are recommended for patients suffering from urinary and

fecal incontinence, an overly active urinary bladder with a continuous urge to urinate, patients suffering from chronic constipation who have tried every form of treatment and have failed with those in the past. The device can be effectively used in improving the quality of life by improving the ability of the patient to delay the emptying of bowels and reduce the number of times in terms of bowel incontinence.

How is the Sacral Nerve Stimulator implanted?

The sacral nerve stimulators can be implanted by the help of a two-phase procedure. In the first phase, the surgeon implants the stimulator device under the skin. This is also known as the test phase. After the implantation of the device under the skin, the patient maintains a record of the bowel and the urinary activity, approving of the device's positive effects. After the test phase which lasts for about two-four days, the patients are implanted with the sacral nerve stimulator device for a prolonged term. The strength of the electrical pulse can be controlled and altered using a remotely-controlled device. The sacral nerve stimulation can be stopped at any given point of time, without damaging the nerves permanently. However, in cases where the battery power becomes less, the surgeon replaces it with another sacral nerve stimulator device.
