The product details covers mechanism of action, dosage and administration, route of synthesis, and pharmacological studies, including product marketed details, regulatory milestones, and other development activities. Further, it also consists of market assessments inclusive of the market forecast, SWOT analysis, and detailed analyst views. It further highlights the market competitors, late-stage emerging therapies, and patent details in the global space.

Drug Summary

Betibeglogene autotemcel, sold under the brand name Zynteglo, is a medication for the treatment for beta thalassemia, a rare and potentially debilitating blood disorder. It was developed by Bluebird Bio and was given breakthrough therapy designation by the U.S. Food and Drug Administration in February 2015. Zynteglo has been shown to be effective at reducing the need for blood transfusion in 2 main studies in patients with beta thalassaemia who required regular blood transfusions. In these studies, out of the 14 patients who did not completely lack beta-globin and were given Zynteglo, 11 of them had sufficiently high levels of red blood cells so that they did not need blood transfusions for at least 1 year after treatment.
