Research Summary

AC Current Transformers (CTs) are electrical devices that are used to measure and transform alternating current (AC) from high values to lower, more manageable values. They are commonly used in electrical power systems to monitor and measure current flow for various applications, including metering, protection, and control. CTs consist of a primary winding, which is connected in series with the primary conductor carrying the current to be measured, and a secondary winding that is connected to measurement or monitoring devices. The primary winding is typically made of a few turns of a heavy-duty conductor, while the secondary winding has many more turns of finer wire. This configuration allows the CT to step down the current magnitude while maintaining a proportional relationship between the primary and secondary current. The secondary current output is generally rated at a standard value, such as 5A or 1A, which can be easily measured with standard instruments. CTs ensure accurate and safe measurement of current in power systems, providing valuable information for system operation, protection coordination, and billing purposes.

The major global manufacturers of AC Current Transformers (CT) include Falco Electronics, Accuenergy, VAC, TE Connectivity, Hioki E.E., Nanjing Zeming Electronic, Flex-Core, AutomationDirect, Shenke, Omega Engineering, Oswell, Weschler Instruments, Electrohms, Yuanxing, J&D Electronics, Electromagnetic Industries LLP, Simpson Electric, etc. The global players competition landscape in this report is divided into three tiers.
