Research Summary

Acrylamide is a chemical compound that can form naturally in certain foods during high-temperature cooking processes, particularly those involving starch-rich foods like potatoes, grains, and coffee beans. It is formed through a reaction between amino acids and sugars in the presence of heat. Acrylamide is a known neurotoxin and a potential carcinogen, which means it may have the ability to cause cancer in animals and has the potential to do so in humans. Human exposure to acrylamide primarily occurs through the consumption of foods that contain high levels of the compound. While the health risks associated with acrylamide are not yet fully understood, organizations such as the World Health Organization (WHO) and food regulatory agencies recommend taking measures to reduce acrylamide exposure by adopting cooking methods that minimize its formation, such as avoiding overcooking, reducing frying temperatures, and adopting a balanced and varied diet that includes low-acrylamide food options.

The major global manufacturers of Acrylamide include Ashland, BASF, Mitsui Chemicals, Ecolab, Anhui Jucheng, SNF Group, Beijing Hengju, Jiangxi Changjiu, Zibo

Xinye, Mitsubishi Chemical, Black Rose, Shandong Ruihaimishan, etc. The global players competition landscape in this report is divided into three tiers.
