Research Summary

Acrylic rubber, also known as ACM (acrylic rubber copolymer), is a synthetic elastomer or rubber-like material that is derived from a combination of acrylic ester monomers. It exhibits excellent resistance to heat, weathering, ozone, and UV radiation, making it well-suited for outdoor applications. Acrylic rubber offers good mechanical properties, including high tensile strength, elongation, and tear resistance, while maintaining flexibility over a wide temperature range. It has good resistance to many oil-based chemicals and fuels, making it suitable for use in automotive seals, gaskets, hoses, and O-rings. Acrylic rubber possesses good electrical insulation properties, contributing to its use in electrical components and insulation materials. It is also known for its low gas permeability, making it an excellent choice for applications requiring barrier properties, such as seals for fuel systems. Overall, acrylic rubber combines heat resistance, weatherability, chemical resistance, and mechanical properties, making it a versatile material in various industrial sectors.

The major global manufacturers of Acrylic Rubber include ZEON, NOK, Haiba,
