Research Summary

Activated alumina is a highly porous form of aluminum oxide with a large surface area, commonly used as a desiccant and adsorbent in various industrial applications. Its structure consists of many interconnected pores, giving it the ability to adsorb moisture and certain impurities from gases and liquids. Activated alumina is created through a process of dehydroxylation of aluminum hydroxide, resulting in a material with a high surface-to-mass ratio. It is often utilized in drying processes to remove water vapor from air and gases, as well as in purification systems to adsorb impurities like fluoride, arsenic, and other contaminants. Additionally, activated alumina is employed in catalytic processes, where its porous structure serves as a support for catalysts in chemical reactions. Its versatility and effectiveness in moisture and impurity removal make activated alumina a valuable material in applications ranging from air and gas drying to water treatment and catalyst support.

The major global manufacturers of Activated Alumina include Honeywell UOP, Axens, BASF SE, Huber, Porocel Industries, Sumitomo Chemical, CHALCO, Shanghai Jiuzhou
