### Research Summary

Agricultural Science Hyperspectral Imaging (HSI) is a technique used in the analysis of agricultural materials that utilizes a range of electromagnetic radiation to identify specific properties of plants, soils, and other related agricultural products. HSI involves the use of advanced sensors to capture images of a wide range of wavelengths, allowing for the precise identification and differentiation of various agricultural components. This technology is widely used in research and development of new crops, crop phenotyping, soil analysis, disease detection, and yield prediction, among other applications. HSI can also be used in precision agriculture to monitor crop health, nutrient status, and other parameters for better management and optimization of crop productivity.
