Research Summary

An All Vanadium Redox Flow Battery (VRFB) is a type of rechargeable battery that stores energy in the form of chemical potential energy. Unlike conventional batteries where energy is stored in electrodes, VRFBs store energy in electrolyte solutions containing vanadium ions in different oxidation states (typically V²⁺/V³⁺ and V⁴⁺/V⁵⁺). These batteries consist of two separate electrolyte tanks and a membrane that allows ions to pass through while preventing the mixing of electrolytes. During charging, electrons are transferred to the positive electrolyte tank, causing vanadium ions to change oxidation states. During discharging, the process is reversed, and the electrons are released from the negative electrolyte tank. VRFBs are known for their scalability, long cycle life, and ability to discharge and recharge simultaneously. They are commonly used in large-scale energy storage applications, such as renewable energy integration, grid stabilization, and backup power systems. Additionally, the use of vanadium-based electrolytes eliminates the risk of cross-contamination and improves the battery's efficiency and durability compared to other redox flow batteries.

The major global manufacturers of All Vanadium Redox Flow Battery include Lonza, Catalent, Samsung Biologics, FUJIFILM Diosynth Biotechnologies, Boehringer Ingelheim, WuXi AppTech, Recipharm, Thermo Fisher Scientific, AGC Biologics, Rentschler Biopharma, KBI Biopharma, Siegfried, Aenova Group, GenScript, ProBioGen, Northway Biotech, 3P Biopharmaceuticals, etc. The global players competition landscape in this report is divided into three tiers.
