Research Summary

Aluminum foil is commonly used as a substrate material for lithium-ion battery cathodes. In lithium-ion batteries, the cathode is one of the key components responsible for the storage and release of lithium ions during charge and discharge cycles. Aluminum foil serves as a support structure for the active material coating, which typically consists of lithium-containing compounds such as lithium cobalt oxide (LiCoO₂), lithium iron phosphate (LiFePO₄), or lithium manganese oxide (LiMn₂O₄). The foil provides mechanical strength and electrical conductivity to the cathode assembly, allowing for efficient electron transfer during battery operation. Additionally, aluminum foil is lightweight, corrosion-resistant, and relatively inexpensive, making it an ideal choice for mass production of lithium-ion batteries used in various applications such as consumer electronics, electric vehicles, and energy storage systems.
