Research Summary

Aluminum sputtering targets for semiconductors are specialized materials used in the physical vapor deposition (PVD) process known as sputtering, commonly employed in semiconductor manufacturing and thin film deposition applications. These targets are typically made of high-purity aluminum metal and are used as the source material for depositing thin films of aluminum onto semiconductor substrates or other surfaces. During the sputtering process, high-energy ions bombard the aluminum sputtering target, causing atoms to be ejected from its surface. These ejected aluminum atoms then travel in a vacuum chamber and deposit onto the substrate, forming a thin film. Aluminum sputtering targets are engineered to have specific dimensions, purity levels, and microstructures to ensure uniform film deposition and high-quality thin films with desired properties such as electrical conductivity, adhesion, and corrosion resistance. These targets play a critical role in the fabrication of semiconductor devices, including integrated circuits, solar cells, flat-panel displays, and optical coatings, by enabling precise and controlled deposition of aluminum thin films for various functional and

structural purposes.

The major global manufacturers of Aluminum Sputtering Target for Semiconductor include Linde, Sumitomo Chemical, Konfoong Materials, TOSOH, Honeywell, ULVAC, Advantec, GRIKIN Advanced Material, etc. The global players competition landscape in this report is divided into three tiers.
