### Research Summary

Ammonia cracking catalysts are materials used in the process of ammonia cracking, which involves decomposing or splitting ammonia (NH<sub>3</sub>) into its constituent elements, nitrogen (N<sub>2</sub>) and hydrogen (H<sub>2</sub>). These catalysts facilitate the ammonia cracking reaction by providing a surface where the ammonia molecules can adsorb and react at lower temperatures and pressures than would otherwise be required. Typically, metal-based catalysts such as nickel (Ni), ruthenium (Ru), or iron (Fe) supported on high-surface-area materials like alumina (Al<sub>2</sub>O<sub>3</sub>) or silica (SiO<sub>2</sub>) are used for this purpose. Ammonia cracking catalysts find applications in various industrial processes, including the production of hydrogen for fuel cells, ammonia decomposition for chemical synthesis, and ammonia removal in catalytic converters for automotive emissions control. By promoting the efficient decomposition of ammonia, these catalysts play a crucial role in enabling sustainable and energy-efficient processes across multiple industries.
