Research Summary

Amorphous nanocrystalline ribbons refer to thin strips or ribbons of metallic materials that exhibit a combination of amorphous and nanocrystalline structures at the nanoscale level. These ribbons are typically made from alloys of metals such as iron, cobalt, nickel, and other elements with high magnetic permeability. The manufacturing process involves rapid solidification techniques such as melt spinning, where molten metal is rapidly cooled to form a thin ribbon with a non-crystalline (amorphous) structure. Subsequent annealing or heat treatment processes can induce the formation of nanocrystalline regions within the amorphous matrix, resulting in a dual-phase structure with unique properties. Amorphous nanocrystalline ribbons exhibit excellent magnetic properties such as high saturation magnetization, low coercivity, and low core losses, making them ideal for use in high-frequency magnetic components such as transformers, inductors, and magnetic sensors. Their thin and flat geometry allows for efficient magnetization and minimized eddy current losses, contributing to energy-efficient and compact magnetic devices in various electronic and power applications.

The major global manufacturers of Amorphous Nanocrystalline Ribbons include Antai Technology, Ningbo Biplas New Materials, Proterial, Ltd.
