Research Summary

Amorphous ribbons refer to thin strips of metallic alloy materials that lack a crystalline structure, hence being termed "amorphous." These ribbons are typically made from special alloys containing elements like iron, nickel, cobalt, and boron. Unlike conventional metallic materials, which have an ordered atomic structure (crystalline), amorphous alloys are formed through rapid solidification techniques, such as melt spinning or splat quenching, which prevent the formation of a crystalline structure. This rapid cooling process traps the atoms in a disordered arrangement, resulting in an amorphous, non-crystalline structure. Amorphous ribbons exhibit unique properties, including high magnetic permeability, low coercivity, and low core loss, making them ideal for applications in transformers, inductors, magnetic sensors, and other electronic devices where efficiency, compactness, and stability are essential. Additionally, their thin and flexible nature allows for easy integration into various designs and applications, contributing to their widespread use in modern technology.

The major global manufacturers of Amorphous Ribbons include Qingdao Yunlu,

Proterial, Ltd. (Formerly Hitachi Metals), Advanced Technology, Zhao Jing Science and Technology, Jiangsu Guoneng Alloy Technology, Henan Zhongyue Amorphous, etc. The global players competition landscape in this report is divided into three tiers.
