Research Summary

Amorphous silica-alumina is a composite material composed of silicon dioxide (silica, SiO₂) and aluminum oxide (alumina, Al₂O₃) without a crystalline structure, hence the term "amorphous." This material is widely used as a catalyst or catalyst support in various chemical processes, particularly in the petrochemical industry. Its unique properties, such as high surface area, acidity, and thermal stability, make it valuable for catalyzing reactions like hydrocracking, isomerization, and alkylation. The absence of a defined crystalline structure allows for more accessible active sites on the surface, enhancing catalytic activity. Amorphous silica-alumina can be synthesized with varying ratios of silica to alumina, allowing tailoring of its properties to suit specific applications. Its versatility and effectiveness have made it a cornerstone in many industrial catalytic processes, contributing significantly to the production of fuels, chemicals, and other essential products.

The major global manufacturers of Amorphous Silica-alumina include W.R. Grace, BASF, Albemarle, JGC C and C, Sinopec, Petrogas Group, Sasol, Stanford Advanced
