### Research Summary

Anisotropic Conductive Adhesive Film (ACF) is a specialized adhesive material used in electronic packaging and assembly processes to make electrical connections between electronic components, such as flexible printed circuit boards (FPCBs) and display panels. ACF consists of a thin film adhesive embedded with conductive particles, typically made of metal-coated polymer spheres or flakes. Unlike traditional adhesives, ACF exhibits electrical conductivity in one direction (anisotropic), allowing it to provide both mechanical bonding and electrical interconnection simultaneously. During the bonding process, ACF is heated and compressed between the components, causing the conductive particles to deform and establish electrical connections between the conductive pads on the components. Once cooled, the adhesive solidifies, creating a reliable bond while maintaining electrical conductivity between the connected components. ACF is commonly used in applications such as flat panel displays, touchscreens, flexible electronics, and semiconductor packaging, where fine-pitch interconnections and reliable electrical performance are essential. Its unique properties

make ACF an effective and versatile solution for achieving high-density, lightweight, and flexible electronic assemblies.

The major global manufacturers of Anisotropic Conductive Adhesive Film (ACF) include Dexerials, Resonac, H&SHighTech, 3M, KUKDO, Btech Corp (ADA Technologies), Tesa Tape, U-PAK, etc. The global players competition landscape in this report is divided into three tiers.
