### Research Summary

An anti-static flexible intermediate bulk container (FIBC) is a specialized type of bulk packaging used for transporting and storing materials that are sensitive to electrostatic discharge (ESD). It is designed to mitigate the risks associated with static electricity in environments where flammable or explosive substances are present. An anti-static FIBC incorporates conductive material, such as carbon or metal threads, into its construction to provide a path for the dissipation of static charges. These bags help to prevent static build-up and discharge by grounding static electricity through the bag's conductive material. By controlling electrostatic charges, anti-static FIBCs minimize the potential for sparks, which could ignite flammable substances, and protect sensitive products, such as chemicals, powders, or electronics, from damage caused by static electricity. Anti-static FIBCs are commonly used in industries like chemicals, pharmaceuticals, electronics, and hazardous materials handling, where the control of static electricity is critical for both safety and product integrity.
