Research Summary

Anticorrosive coatings for thermal power industry are coatings that are specifically designed to protect components and structures used in thermal power plants from corrosion and wear caused by the harsh operating conditions of the plant. These coatings help to maintain the structural integrity and reliability of equipment and reduce maintenance costs. The coatings are typically applied to a variety of metal surfaces including pipelines, vessels, tanks, and heat exchangers to prevent the formation of corrosion, rust, and other forms of degradation. They are designed to provide long-lasting protection against harsh environments such as high temperatures, moisture, and corrosive gases. Some of the common types of anticorrosive coatings used in thermal power plants include epoxy coatings, polyurethane coatings, polysiloxane coatings, and acrylic coatings. These coatings can be applied by brushing, spraying, or dipping, depending on the specific needs of the application. In a highly corrosive environment like a thermal power plant, anticorrosive coatings are crucial in ensuring the plant's safe and efficient operation. Without proper protection, the equipment and structures would

quickly deteriorate and fail, leading to costly downtime and repairs.
