Research Summary

An Arrayed Waveguide Grating (AWG) device is a passive optical component that is used in dense wavelength division multiplexing (DWDM) systems to combine or split optical signals into multiple channels. The device is made up of an array of optical waveguides that are precisely arranged to produce interference patterns that channel different wavelengths of light to different output ports. AWG devices are designed with high precision to ensure minimal crosstalk and insertion loss, making them particularly useful in optical communication systems where multiple channels of light need to be transmitted or received simultaneously.
