### Research Summary

Arterial catheters are thin, flexible tubes inserted into an artery, usually in the wrist or groin area, to monitor blood pressure and provide access for blood sampling. They are commonly used in critically ill patients who require continuous invasive blood pressure monitoring and frequent blood tests. Arterial catheters allow healthcare providers to quickly and accurately determine a patient's blood pressure and detect changes in blood oxygenation levels. They also provide a continuous source of arterial blood for laboratory analysis. However, due to their invasive nature and risk of infection and other complications, arterial catheters are usually reserved for patients in intensive care settings.
