Research Summary

An arthroscope is a medical device that consists of a fiber optic camera and specialized instruments used to visualize and treat joint problems. It is a minimally invasive surgical tool that is inserted into a joint through a small incision, allowing the surgeon to see the inside of the joint on a screen and make repairs without the need for open surgery. Arthroscopy is widely used to diagnose and treat a wide range of joint issues including damaged cartilage, ligament tears, and other injuries or conditions causing joint pain and dysfunction.
