Research Summary

An articular goniometer is a specialized instrument used in physical therapy, rehabilitation, and orthopedic settings to measure the range of motion (ROM) of joints in the body. It consists of two arms that pivot at a central fulcrum, allowing the clinician to align the arms with the anatomical landmarks of the joint being assessed. The goniometer provides precise measurements in degrees, enabling healthcare professionals to evaluate joint flexibility, monitor progress in rehabilitation, and assess the effects of injury or surgery. There are various types of goniometers, including universal goniometers, digital goniometers, and inclinometers, each designed for specific applications and ease of use. Accurate assessment of joint motion is crucial for developing effective treatment plans and ensuring optimal recovery outcomes for patients.
