Research Summary

An assistive listening device, or ALD, is a device that amplifies sound to aid communication for people with hearing loss or difficulty hearing in certain situations. ALDs can be used in a variety of settings, such as classrooms, theaters, and conference rooms, and can include devices such as personal amplifiers, FM systems, hearing loops, and captioning systems. They work by amplifying and clarifying speech or other sounds, making it easier for the listener to hear and understand. ALDs can be particularly useful for individuals with mild to moderate hearing loss, but they can also benefit those with severe hearing loss or deafness when used in conjunction with other assistive technologies, such as cochlear implants or hearing aids.
