### Research Summary

Atomic Layer Deposition (ALD) Device is a type of equipment used in the display industry to deposit ultra-thin films onto the surface of substrates. The aim of using ALD for display applications is to improve the performance, efficiency, and durability of displays, particularly in OLED (organic light-emitting diode) and QLED (quantum dot light-emitting diode) technologies. The ALD device for display works by introducing gaseous precursors one at a time into the reaction chamber, where they react with the substrate's surface, creating one atomic layer at a time. The process is highly controllable, allowing the thickness of the deposited film to be precisely controlled, resulting in uniform and defect-free films. ALD is becoming an important technology in the production of high-quality displays, providing an effective way to create thin, transparent, and conductive films that are required in modern displays. It is commonly used for depositing materials like aluminum oxide, titanium dioxide, and zinc oxide, which act as protective layers, barrier layers, and charge transport layers in OLED and QLED displays.

The major global manufacturers of Atomic Layer Deposition Device for Display include Jusung Engineering, NCD, Beneq, Encapsulix, Picosun, Forge Nano, Veeco, etc. The global players competition landscape in this report is divided into three tiers.
