Research Summary

An Automated External Defibrillator (AED) is a portable electronic device that can automatically diagnose cardiac arrhythmias and deliver an electric shock to the heart in order to restore normal rhythm. It is used in the event of sudden cardiac arrest, which occurs when the heart unexpectedly stops beating due to a disturbance in its electrical system. AEDs are designed to be used by non-medical personnel and often are found in public locations such as airports, schools, and shopping malls. Using an AED can significantly increase the chances of survival following cardiac arrest.
