### Research Summary

Automotive Active Suspension System is a system that uses computer-controlled sensors and actuators to adjust the suspension of a vehicle in real-time to provide a comfortable and stable ride. It is designed to minimize the impact of uneven roads, potholes, and other obstacles on driving performance, and to improve handling and safety. The system consists of sensors that detect changes in the road surface, a computer that analyzes the data and determines the appropriate suspension settings, and actuators that adjust the suspension to match the road conditions. There are different types of active suspension systems available, such as hydraulic, electromagnetic, and pneumatic systems.
