Research Summary

An automotive air intake manifold is a component that is part of the engine's air intake system. Its main function is to distribute the air/fuel mixture to the engine's cylinders. The manifold is typically made of cast aluminum or plastic, and features several ports or runners that direct the air into each cylinder. The manifold is located on top of the engine and is attached to the engine block with bolts. The air is drawn into the manifold through the air filter and passes through the throttle body before flowing through the manifold runners and into the cylinders. The design of the manifold can have a significant impact on the engine's performance and efficiency, as it affects the flow and distribution of the air/fuel mixture.
