### Research Summary

Automotive gas springs, also known as gas struts or lift supports, are hydraulic devices used in vehicles to provide smooth and controlled motion. These springs are typically filled with compressed gas, either nitrogen or a mixture of nitrogen and oil, which helps to provide resistance to motion. They are often used in vehicles to support hoods, trunks, and tailgates, and to assist in opening and closing doors. The use of gas springs helps to reduce overall weight and provide a safer and more controlled operation for the vehicle.
