Research Summary

An automotive height sensor, also known as a ride height sensor or suspension position sensor, is a type of sensor used in vehicles to monitor the height of the suspension system. It is usually located in the suspension strut or on the control arm and measures the distance between the chassis and the ground. The sensor sends this information to the vehicle's control module, which uses it to adjust the suspension system's height and maintain the correct ride height for the vehicle. Maintaining the correct ride height is essential for vehicle stability, handling, and braking performance.
