Research Summary

An Automotive Thermal Management Valve (ATMV) is a valve that controls engine coolant flow between the engine and the radiator to regulate the temperature of the engine and the passenger compartment. This valve can be electronically controlled or mechanically operated and adjusts the volume of coolant that passes through the system to balance the heat generated by the engine. The ATMV works by opening or closing based on input signals from sensors that monitor the engine temperature and the ambient air temperature outside the vehicle. Proper regulation of the engine temperature can improve fuel efficiency, reduce emissions, and increase engine lifetime.
