Research Summary

Autonomous Mobile Robots (AMR) are robotic systems that are capable of moving and navigating in an unstructured and dynamic environment independently, without the need for human intervention or external guidance. These robots use a combination of sensors, cameras, and algorithms to perceive their surroundings, map their environment, and make decisions about their actions. AMRs are widely used in various applications such as logistics and warehousing, manufacturing, healthcare, and agriculture. They are designed to increase efficiency, productivity, and safety in various industries by performing repetitive tasks and freeing up human labor for more complex activities.
