Research Summary

Autonomous Surface Vessels (ASVs) ranging from 6 to 24 feet are unmanned watercraft equipped with autonomous navigation systems that allow them to operate without direct human intervention. These vessels utilize a combination of sensors, including GPS, radar, lidar, and cameras, along with advanced algorithms, to navigate waterways, avoid obstacles, and follow pre-programmed routes. ASVs are used in various applications, including oceanographic research, environmental monitoring, maritime surveillance, and offshore inspections. They offer advantages such as reduced operational costs, extended mission endurance, and improved safety by removing the need for onboard crew members in hazardous or remote maritime environments. ASVs are adaptable platforms capable of carrying a variety of payloads, sensors, and scientific instruments to collect data, perform tasks, and execute missions autonomously, making them valuable tools for a wide range of marine applications.
