### Research Summary

An Azo polymerization initiator is a type of chemical compound used to initiate or catalyze the polymerization process in the production of certain types of polymers. Azo initiators contain azo (-N=N-) functional groups, which undergo homolytic cleavage upon exposure to heat or light, generating free radicals. These free radicals then initiate the polymerization reaction by reacting with monomer molecules, leading to the formation of polymer chains. Azo initiators are commonly used in the production of acrylic, vinyl, and styrene-based polymers. The choice of azo initiator depends on factors such as the desired polymerization temperature, polymerization rate, and stability. Common examples of azo initiators include azobisisobutyronitrile (AIBN) and 2,2'-azobis(2-methylpropionitrile) (AMBN). Azo polymerization initiators play a crucial role in the manufacturing of various plastic products, coatings, adhesives, and other polymer-based materials.

The major global manufacturers of Azo Polymerization Initiator include FUJIFILM Wako Pure Chemical Corporation, Otsuka Chemical Co., Ltd., Nouryon Holding B.V., The
