Research Summary

Balancing machines are machines used to determine the distribution of weight of an object such as a rotor, a fan, a crankshaft, or any other rotating or reciprocating object. The machine can detect and quantify the amount and location of any weight imbalances in the object. Balancing machines use sensors and computation algorithms to identify and measure imbalances, which allows them to correct any such imbalances by removing or adding weight to the object. Balancing machines are used in the manufacturing and maintenance of various types of machinery to ensure their smooth and efficient operation and to reduce wear and tear on bearings, shafts, and other components.
