Research Summary

A ball valve is a type of valve that uses a hollow, perforated and pivoting ball to control the flow of fluid through it. The ball pivots on its axis to open and close the valve. When the valve is open, fluid can flow through. When it is closed, the ball seals against the valve's opening to prevent any further flow. Ball valves are often used in applications where full bore, zero leakage, and easy operation are required. They are commonly used in plumbing, industrial, and oil and gas applications.
