Research Summary

Bare metal stents are small, wire mesh tubes that are used to treat narrowed or blocked arteries in the body. They are made of stainless steel or other metals, and are used to prop open arteries that have become narrowed or blocked due to plaque buildup. Bare metal stents do not have a coating or drug on them, and they are inserted into the artery via a catheter during a minimally invasive procedure. Once in place, bare metal stents help to restore blood flow and prevent the artery from narrowing or closing again. They are typically used in patients with single blockages or in cases where drug-eluting stents are not suitable.
