Research Summary

Barium fluoride crystal, often denoted as BaF₂, is a transparent crystalline material with exceptional optical properties. Its wide transmission range, spanning from ultraviolet (UV) to infrared (IR) wavelengths, along with a high refractive index and low dispersion, makes it ideal for optical components like lenses, windows, prisms, and filters in various optical systems. Notably, BaF₂ crystals exhibit high resistance to radiation damage, making them valuable in applications involving high-energy radiation such as X-ray imaging and gamma-ray spectroscopy. They are also used in scintillation detectors for detecting and measuring radiation in scientific research, medical imaging, and nuclear physics experiments. Additionally, BaF₂ crystals are non-hygroscopic, ensuring stability and optical performance in different environments.
