Research Summary

Bearings are mechanical components used to reduce friction and enable smooth rotational or linear movement between two or more parts. They are designed to support and guide the motion of rotating shafts or other moving components within a machine or system. Bearings typically consist of two main components: the inner ring (also known as the inner race) and the outer ring (or outer race), which are separated by rolling elements such as balls, cylindrical rollers, or tapered rollers. These rolling elements are held in place by a cage or separator. Bearings facilitate the transfer of loads, allowing parts to rotate or move with minimal friction and wear. They come in various types, including ball bearings, roller bearings, and plain bearings, each suited to different applications based on factors such as load capacity, speed, and environmental conditions. Bearings are vital components used in a wide range of industries, including automotive, aerospace, manufacturing, and machinery, contributing to the smooth and efficient operation of countless devices and systems.

The major global manufacturers of Bearings include SKF, Schaeffler, NSK, NTN, JTEKT, C&U GROUP, MinebeaMitsumi, Timken, Rexnord, NACHI, LYC, NBC
