Research Summary

Bicomponent fiber, also known as dual-component or multi-component fiber, is a type of synthetic fiber composed of two or more different polymer components. These components are typically arranged in a core-sheath or side-by-side configuration within a single fiber. The core and sheath components can have distinct properties, such as different melting points, chemical resistance, or mechanical strength. Bicomponent fibers are manufactured using specialized spinning techniques that enable the extrusion of multiple polymers simultaneously. The resulting fiber combines the beneficial properties of each component, such as softness, elasticity, moisture management, or thermal stability. Bicomponent fibers find applications in various industries, including textiles, nonwovens, hygiene products, filtration, and technical textiles, where their unique characteristics are utilized to enhance performance and functionality in a range of end products.

The major global manufacturers of Bicomponent Fiber include FiberVisions Corporation, Kolon, Huvis, Hyosung, Far Eastern New Century, Dupont, Toray Advanced Materials
