### Research Summary

Bicycle brakes are essential components that enable the rider to slow down or bring the bike to a complete stop. They provide control and safety during rides by allowing the rider to modulate their speed and maneuverability. Bicycle brakes typically consist of two main types: rim brakes and disc brakes. Rim brakes use friction pads that are pressed against the rim of the wheel to create friction and slow down the bike. They are commonly found on road bikes and some hybrid and mountain bikes. Disc brakes, on the other hand, use a caliper with brake pads that clamp onto a rotor attached to the wheel hub. This mechanism provides increased stopping power and better performance in wet or muddy conditions. Disc brakes are widely used in mountain bikes and are becoming more popular in other types of bicycles as well. Both types of brakes can be operated by either mechanical or hydraulic systems, with hydraulic brakes offering more precise and powerful braking. Choosing the right type of brake system depends on factors such as riding style, terrain, and personal preference. Proper maintenance, regular inspection, and brake pad replacement are important for optimal brake performance and rider safety.

The major global manufacturers of Bicycle Brakes include Shimano, TEKTRO, Magura, Campagnolo, SRAM, Promax Components, Hayes Performance Systems, APSE Group, Bengal, Clarks Cycle Systems, Hope Tech, Formula, Full Speed Ahead (FSA), Alligator, Cane Creek, ORIGIN8, etc. The global players competition landscape in this report is divided into three tiers.
