Research Summary

A bicycle suspension system is a collection of components designed to absorb and dampen impacts and vibrations, improving the rider's comfort and control over rough terrain. It typically consists of a front suspension fork and a rear suspension system. The front suspension fork is located on the front wheel and utilizes a system of springs and/or air chambers along with dampers to absorb shocks from bumps and uneven surfaces. The rear suspension system, found on full-suspension bikes, includes a rear shock absorber that allows the rear wheel to move independently from the frame. This helps to maintain traction, improve stability, and reduce fatigue on the rider. Suspension systems are commonly used in mountain bikes and some hybrid and gravel bikes, providing a smoother ride and allowing riders to tackle more challenging terrains with greater confidence and control. Different suspension designs and technologies exist, each offering unique characteristics and adjustments to suit various riding styles and preferences.

The major global manufacturers of Bicycle Suspension System include Fox Factory,
