Research Summary

Bioabsorbable stents, also known as biodegradable stents or resorbable scaffolds, are medical devices used to treat coronary artery disease. They are similar to traditional metallic stents, which are inserted into narrowed or blocked arteries to restore blood flow. However, unlike metallic stents that remain in the body permanently, bioabsorbable stents are designed to gradually dissolve and be absorbed by the body over time. Bioabsorbable stents are typically made from materials such as polylactic acid (PLA) or polyglycolic acid (PGA), which are biocompatible and biodegradable. These stents provide temporary support to the affected artery, keeping it open and allowing blood flow to be restored. Over a period of time, the stent material breaks down into smaller components that can be metabolized and eliminated by the body's natural processes. The major advantage of bioabsorbable stents is that they eliminate the long-term presence of a permanent metallic implant in the artery, which may cause complications such as stent thrombosis or the need for additional procedures in the future. Additionally, they may also allow the treated artery to regain its natural function and flexibility.

The major global manufacturers of Bioabsorbable Stents include Abbott Vascular, Boston Scientific, Kyoto Medical Planning, Arterial Remodeling Technologies, Elixir, etc. The global players competition landscape in this report is divided into three tiers.
